

Snake River Shark Official Report Unclassified

- **Date:** 19/11/2024
- **Case ID:** PIUC010
- **This report was conducted by:** Agent *****
- **Grade Level:** N/A
- **Alert Level:** AL1

Introduction

Outdoor enthusiasts who flock to Southern Idaho, to the Perrine Bridge just outside of Twin Falls, claim to sometimes see what looks like a shark swimming in the Snake River. Local authorities are aware of the sightings and have even told members of the public that there were shark attacks whenever heavy police presence is found at the bridge.

Findings

While the argument can be easily made that we don't know all of wildlife or what's in the water, in this case the results is open and shut. This particular area of Idaho is popular among outdoor enthusiasts for kayaking, base jumping, parachuting, etc... The stretch of the Snake River happens to run underneath the Perrine Bridge and the Evel Knievel jump site. The Perrine Bridge is one of the last bridges in the US where it is still legal to jump from, something known to lure quite a few people in a darker state of mind.

Police presence around the bridge is quite common under these circumstances. Local officers have been known to have a darker sense of humour in order to cope with the stresses of the job and try their best to avoid romanticizing and publicizing people in their darkest hours. As such, when people block traffic in order to get a peak at any dramatic events, the police have been known to joke with onlookers and say there was a shark attack.

However, there is a heavily monitored sturgeon population in the area. Someone who doesn't know much about aquatic life could see just the dorsal fin and automatically flip out thinking there is a small shark. Especially with the large number of people who move from California to Idaho for cheaper cost of living.

Normally the sturgeon follow a bit of migratory patterns for reproduction but on a few occasions wildlife authorities have noticed sometimes certain sturgeon decide to not return to breeding grounds like normal. There is no sign that these fish are ill but the tags placed on the fish show that they are alive and well.

Recommendations

Overall, the recommendations that were made from this report were that of no conclusive evidence to support the theory of a shark or related within the area.

Conclusion

To conclude this report, the findings show that the evidence presented were not conclusive enough to suggest that this was credible evidence and as such the official conclusion would be nothing more than urban legend.

This report was conducted by the authority of the International Bureau of Paranormal Investigation and Research.
